The dimpled oil rail support is designed too prevent the oil ring groove spacer from turning in the groove, which causes the oil ring package to collapse. When the non-rotating dimpled oil rail support is properly installed, the oil ring pack will not allow the tab to move past the wrist pin bore. Finally, the problem of collapsed oil rings due to oil rail support spacer rotation has been solved! The dimpled oil rail support only applies to pistons with short compression heights, where the pin bore extends up into the oil ring groove.
